

VENCO Vertical Axis Windturbine Products

VENCO Power's core business comprises the development, the manufacturing, the marketing and sale of small wind power systems, using wind energy to generate electricity. The major difference between our wind power systems and commonly known wind turbines is the Vertical Axis Technology. One example for these technological innovations is the new rotor concept, which significantly increases harvested energy compared to traditional VAWTs. It also reduces noise emission to zero compared to both, traditional HAWTs and VAWTs.

In this section, you may find information about VENCO Power's windturbine products.

VENCO Power combines local expertise and global experience. Currently VENCO Power is building up a worldwide sales and service network, because we want working relationships with turbine owners beyond delivery.

In brief, VENCO Power cares for its turbines, no matter where in the world they may be. This ensures that VENCO remains a truly trustworthy partner.
